

Testing app: <https://bookcart.azurewebsites.net/>

Create a Cypress project using a monorepo strategy and TypeScript with two separate apps within the project.

First App Test:

1. Login
 2. Add 2 books of your choice to the wishlist
 3. Check the wishlist badge
 4. Go to the wishlist
 5. Add a book you want to buy to the cart and remove it from the wishlist
 6. Check both wishlist and cart badges
 7. Go to the cart
 8. Complete the buying process
-

Second App Test:

1. Open the 'swagger' menu page
 2. Verify that the login API exists
-

Before each test, a preparation test should be called. In this prep test, ensure that:

- The books being used in the test exist
 - A Cypress session for login is created
-

Additional requirements:

- Implement a Page Object Model (POM)
 - Define separate test calls for each app in the scripts
 - Use fixture files for test data in each test spec
 - Ensure all code is properly typed
-

Please submit your solution as Git repository link.

We look forward to reviewing your approach and implementation.
